**Fig 1: Australia Ghost Antipode Detail.** Australia is antipodal to the space encompassed by the large Yellow impact signature hyperbola of Fig 1. Most heavily mineralised (and salt-laked) WA is antipodal to its most energetic "head". Similarly heavily mineralised NW Australia is overlapped by both the Yellow and Red hyperbolae. The E Antarctic coastal potential follows E shore of Hudson Bay, Quebec tundra edge, Bermuda shallows, where the West Australia coastal potential takes over. Antarctica's three dome potentials are at a bay, a channel and a deep. Base of Antarctic Peninsula potential encompasses Iceland.
